Notes :
1. Heights of walls
   Front : 59-1/16in
   Suction side : 19-11/16in
   Side : Height unrestricted
   The installation space shown in this figure is based on the condition of cooling operation at the outdoor air temperature of 95°F.
   The installation space of suction side shown above must be expanded in the following case.
   · Design outdoor temperature becomes over 95°F.
   · Operating over Max. operating load (In case of causing a heavy heating load at indoor unit side)
2. If the above wall heights are exceeded then h2/2 and h1/2 should be added to the front and suction side service spaces respectively as shown in the following figure.
3. When installing the units the most appropriate pattern should be selected from those shown above in order to obtain the best fit in the space available always bearing in mind the need to leave enough room for a person to pass between units and wall and for the air to circulate freely.
   (If more units are to be installed than are catered for in the above patterns your layout should take account of the possibility of short circuits.)
4. The units should be installed to leave sufficient space at the front for the on site refrigerant piping work to be carried out comfortably.

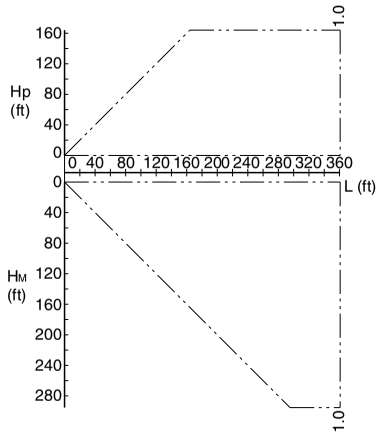
2. Rate of change in heating capacity



[Explanation of symbols]
Hp : Level difference (ft) between indoor and outdoor units where indoor unit in inferior position
HM : Level difference (ft) between indoor and outdoor units where indoor unit in superior position
L : Equivalent pipe length (ft)
α : Capacity correction factor

[Diameter of pipe (standard size)]

Model	liquid

REYQ216PYDN REYQ216PTJU	ϕ 5/8

[Notes]
1. These figures illustrate the rate of change in capacity of a standard indoor unit system at maximum load (with the thermostat set to maximum) under standard conditions.
   Moreover, under partial load conditions there is only a minor deviation from the rate of change in capacity shown in the above figures.
2. With this outdoor unit, evaporating pressure constant control when cooling, and condensing pressure constant control when heating is carried out.
3. Method of calculating A/C (cooling/heating) capacity:
   The maximum A/C capacity of the system will be either the total A/C capacity of the indoor units obtained from capacity characteristic table or the maximum A/C capacity of outdoor units as mentioned bellow, whichever smaller.
   Calculating A/C capacity of outdoor units
   - Condition: Indoor unit combination ratio does not exceed 100%.

     Maximum A/C capacity of outdoor units = A/C capacity of outdoor units obtained from capacity characteristic table at the 100% combination × Capacity change rate due to piping length to the farthest indoor unit
   - Condition: Indoor unit combination ratio exceeds 100%.

     Maximum A/C capacity of outdoor units = A/C capacity of outdoor units obtained from capacity characteristic table at the combination × Capacity change rate due to piping length to the farthest indoor unit
4. When overall equivalent pipe length is 295.3ft or more, the diameter of the main liquid pipes (outdoor unit-branch sections) must be increased.
   When level difference is 164.0ft or more, the diameter of the main liquid pipe (outdoor unit-branch sections) must be increased.

5. When the main sections of the interunit liquid pipe diameters are increased the overall equivalent length should be calculated as follows. (Heating only)

   Overall equivalent length = Equivalent length to main pipe x Correction factor + Equivalent length after branching

   [Choose a correction factor from the following table]

Model	Correction factor
REYQ72PYDN REYQ72PTJU	0.2
REYQ216PYDN REYQ216PTJU	0.4

   (Example) In case of REYQ216PYDN

   In the above case (Heating)
   Overall equivalent length = 200ft × 0.4 + 100ft = 180ft
   The correction factor in capacity when Hp = 0ft is thus approximately 1.0.
6. In the combination which does not include cooling only indoor unit, Calculate the equivalent length pipe by the following when you calculate cooling capacity.

   Overall equivalent length = Equivalent length to main pipe × 0.5 + Equivalent length after branching

   (Example)

   In the above case (Cooling)
   Overall equivalent length = 200ft × 0.5 + 100ft = 200ft
   The correction factor in capacity when Hp = 0m is thus approximately 0.86.
